Agenda

- Amazon RDS fundamentals
- Intro to Amazon RDS Proxy
- Demo setting up your first proxy
- Deep dive into Amazon RDS Proxy settings and behavior
- Demo scaling a serverless app
- Monitoring, availability, and pricing
- Q&A

Amazon RDS fundamentals

© 2020, Amazon Web Services, Inc. or its Affiliates. All rights reserved.

Amazon RDS

Managed relational database service with a choice of popular database engines

Challenges with interacting with databases

Many applications, including serverless apps, have a large number of open DB connections and high connection open/close rate, exhausting DB resources

ĺ	

Modern apps can have 1,000s of DB connections, exhausting DB resources Self-managed proxy servers help manage DB load but are difficult to deploy Custom failure handling code can contain security risks like DB credentials

Amazon RDS Proxy – Generally Available!

Fully managed, highly available database proxy feature for Amazon RDS. Pools and shares DB connections to make applications more scalable, more resilient to database failures, and more secure.

Pool and share DB connections for improved app scaling

Increase app availability and reduce DB failover times

Manage app data security with DB access controls

Fully managed DB proxy, compatible with your database

Amazon RDS Proxy – how it works

aws

Amazon RDS Proxy – authorization

Amazon RDS Proxy – network access

Connection pooling

- Share database connections between transactions with multiplexing
- Detection of session state altering operations causes **pinning**

Seamless and faster failovers

- Application connections preserved during failovers
- Detects failovers and connects to standby quicker, bypassing DNS caches
- Up to 66% faster failover times

Customer success

"We have a serverless API infrastructure based on Lambda that is expected to support tens of thousands of users and requires a scalable backend datastore. While we have traditionally relied on NoSQL databases for such scenarios, the challenge in this situation was that we needed strong SQL guerying capabilities to manage and access the data provided by Amazon RDS and Aurora databases. We can now address this challenge with Amazon RDS Proxy in front of our Amazon RDS and Aurora databases. In our testing, we observed 4X improvement in response times with Amazon RDS Proxy at peak loads. Amazon RDS Proxy is beneficial for us since we can use familiar SQL statement with our relational databases and all we needed to do was to simply switch the endpoint."

-Masahiro Arai, Digital Strategy Division, CAINZ

Demo

Already provisioned:

- Amazon EC2 web server (PHP App)
- Aurora database (MySQL)
- Database Secret

Next steps:

- Provision Amazon RDS Proxy
- Update app DB configuration

Introduce failure:

- Without Amazon RDS Proxy
- With Amazon RDS Proxy

Demo – starting architecture

Demo – ending architecture

aws

Improved failover and security

© 2020, Amazon Web Services, Inc. or its Affiliates. All rights reserved.

Failover test results – "out of box" settings

Failover test results – "optimized" settings

79% Improvement Aurora MySQL Failover Recovery Time (db.r5.large) **Optimized Client** 35,000 CLIENT RECOVERY TIME IN MSEC 30,000 25,000 20,000 15,000 10,000 5,000 10 13 16 19 22 25 28 31 34 46 55 58 61 64 67 70 73 76 79 82 85 88 91 94 97 100 37 40 49 52 Proxy (MariaDB Driver) Direct (Maria DB Aurora Driver)

Improved application security

Enforce IAM authentication with your relational databases

Centrally manage database credentials using Secrets Manager

Connectivity
Secrets Manager secret(s) Info Create or choose Secrets Manager secret(s) representing the credentials for database user accounts that the proxy can connect to.
Choose one or more secret(s)
Create a new secret 🗹
IAM role Create or choose the IAM role the proxy will use to access the AWS Secrets Manager secret(s).
Create IAM role
IAM authentication You can use IAM authentication to connect to the proxy in addition with specifying database credentials. Define how you want to use IAM authentication with the proxy. This will apply to all secrets selected above.
Required 🔹

Improved application security

Enforce IAM authentication with your relational databases

Centrally manage database credentials using Secrets Manager

Eliminate passwords embedded in code

def get_connection():

```
try:
    client = boto3.client("rds")
   DBEndPoint = os.environ.get("DBEndPoint")
   DatabaseName = os.environ.get("DatabaseName")
   DBUserName = os.environ.get("DBUserName")
    token = client.generate db auth token(
        DBHostname=DBEndPoint, Port=3306, DBUsername=DBUserName
    sslCert = {'ca': './AmazonRootCA1.pem'}
    conn = pymysql.connect(
        host=DBEndPoint,
        port=3306,
        database=DatabaseName,
        user=DBUserName,
        password=token,
        ssl=sslCert,
        connect timeout=5
    return conn
except Exception as e:
   print ("While connecting failed due to :{0}".format(str(e)))
   return None
```

Architecture and behavior

Connection pooling

 Reduces the overhead associated with opening and closing connections and with keeping many connections open simultaneously

• Connection pooling simplifies your application logic

Connection multiplexing

- Transaction-level connection reuse
- Sharing DB connections between client connections
- Minimizes the memory overhead for connections on the database server
- Excludes pinned connections

Pinned connections

- Session state change
- Set of system variables, sets of user-defined variables, call of locking functions, table locks, tmp tables, prepared statements, prepared calls
- Long queries (>16KB)
- Not pinning on:
 - Char set changes, TZ, collation
 - Autocommit
 - SQL mode
- Not detected from stored procedures

Avoiding pinned connections

- Use same set of variables and session settings for all client connections
 - Initialization query
- Skip pinning behavior with Session Pinning Filters
 - EXCLUDE_VARIABLE_SETS
- Failovers
 - Client connections are closed
 - Need to reconnect and set session again

Other considerations for Amazon RDS Proxy

- All connections in the connection pool are handled by the writer instance; to perform load balancing for readintensive workloads, use the reader endpoint
- Amazon RDS Proxy must be in the same VPC as the database; the proxy can't be publicly accessible, the database can be
- You can associate multiple proxies with the same DB instance or cluster. A proxy can be associated with 1 DB instance or cluster
- Amazon EC2 databases are not supported
- Proxies listen on default port (3306 or 5432)
- Compression mode is not supported, additional pinning characteristics (MySQL)
- Query cancellation not supported, lastval() aren't always accurate (Postgres)

Demo

- Aurora database (MySQL)
 - Sample data
- Secrets Manager
- Amazon RDS Proxy

Next steps:

- Connect Lambda function
- Enforce TLS
- Enforce IAM authentication
- Review CloudWatch metrics

Monitoring Amazon RDS Proxy

Amazon RDS Proxy pricing

© 2020, Amazon Web Services, Inc. or its Affiliates. All rights reserved.

Amazon RDS Proxy Pricing

- Billed per vCPU per hour for each database instance
- Partial hours are billed in one-second increments with a 10-minute minimum charge
- Minimum 2 vCPUs charge
- Price per vCPU varies per AWS Region

Pricing info: https://aws.amazon.com/rds/proxy/pricing/

Amazon RDS Proxy Pricing – Example

- US East (N. Virginia) Region: \$0.015 per hour
- m5.large database instance (2 vCPUs)
- Amazon RDS Proxy pricing = \$0.015 per vCPU-hour x 2 vCPUs = **\$0.030/hour**
- For a 30-day month your bill would show 1,440 vCPU hours
 (2 vCPUs x 24 hours x 30 days) at \$0.015 per RDS Proxy vCPU hour = \$21.60/month

Pricing info: https://aws.amazon.com/rds/proxy/pricing/

Amazon RDS Proxy availability

Available in 13 regions:

- US East (N. Virginia)
- US East (Ohio)
- US West (N. California)
- US West (Oregon
- Asia Pacific (Mumbai)
- Asia Pacific (Seoul)
- Asia Pacific (Singapore)
- Asia Pacific (Sydney)
- Asia Pacific (Tokyo)
- Canada (Central)
- Europe (Frankfurt)
- Europe (Ireland)
- Europe (London)

Supports the following engines:

- Amazon RDS MySQL 5.6 and 5.7
- Aurora MySQL 5.6 and 5.7
- Amazon RDS PostgreSQL 10.11 and 11.5
- Aurora PostgreSQL 10.11 and 11.5

Customer success

Acould[®]

"We are continuously on the lookout to optimize and improve performance and scalability for our customers. Since Drupal does not natively support connection pooling, we wanted a solution that would allow us to better scale our applications connections on relational databases. Amazon RDS Proxy fits the bill perfectly! With Amazon RDS Proxy, our customer's Drupal applications are able to easily utilize a ready pool of established connections. This has allowed us to both better manage sudden surges in website traffic and improve the efficiency of our databases."

-Ed Brennan, Chief Architect, Acquia

Amazon RDS Proxy – wrap up

- ✓ Applications with unpredictable workloads
- ✓ Applications that frequently open and close database connections
- ✓ Applications that keep connections open but idle
- ✓ Applications requiring availability throughout transient failures
- \checkmark Improved security and centralized credentials management
