Customer highlight: Roche

Challenge
In its journey to improve the development of and access to new personalized treatments, Roche sought to unify varying data modalities to generate a more holistic view of an individual. However, its existing data workflows were unable to unify and analyze varying data modalities requiring a new approach.

Solution
Using AWS, Roche developed Apollo, which enables Roche to streamline and scale multi-modal data analysis, uniting real-world, clinical trial, imaging, pathology, radiology, electronic health records (EHR), wearables, and genomic data.

Results
- Reduced time to analyze image files from three days down to hours
- Reduced time to process EHR data from two days down to minutes
- Cost-effectively scaled to store data from over 200,000 patients and house more than 50 million images
- Support 1,300 scientist across 40 Roche sites globally

“By using AWS to connect the multi-modal data sets that still exist in most clinical settings and provide collaboration tools and intuitive workflow products for researchers to analyze these datasets in tandem, Roche is taking steps closer towards their mission to provide every patient with the best treatment possible in the fastest time possible.”

Head of Personalized Healthcare, Pharma Informatics, Roche
